

Email Functionality Setup Guide - Mindful Champion

Investigation Summary

Issues Found:

1. **Resend Domain Not Verified** ❌
 - The `mindfulchampion.com` domain is NOT verified in Resend
 - This is preventing ALL emails from being sent
 - Error: "The mindfulchampion.com domain is not verified"
 2. **Missing `logEmailNotification` Function** ✅ FIXED
 - The unified-email-service was calling a non-existent function
 - Added the function to `lib/email/log-email.ts`
 3. **No Gmail Fallback Credentials** ⚠️
 - The `.env.local` file is missing `EMAIL_USER` and `EMAIL_APP_PASSWORD`
 - Fallback email system cannot work without these
 4. **Database Status** ⓘ
 - The local database is empty (0 users, 0 email notifications)
 - Production data is likely stored in a separate database (Vercel)
-

Solution Steps

Step 1: Verify Resend Domain (REQUIRED)

This is the **PRIMARY** issue preventing emails from working.

1. Log in to your Resend account: <https://resend.com/login>
2. Navigate to "Domains" section: <https://resend.com/domains>
3. Check if `mindfulchampion.com` is listed
4. If not listed, add it:
 - Click "Add Domain"
 - Enter: `mindfulchampion.com`
 - Follow the verification steps

5. Add DNS records to your domain registrar:

...

Type: TXT

Name: `_resend`

Value: [Provided by Resend]

Type: MX

Name: `@`

Priority: 10

Value: `feedback-smtp.us-east-1.amazonses.com`

Type: TXT

Name: @

Value: "v=spf1 include:amazonses.com ~all"

Type: CNAME

Name: [unique-identifier]_domainkey

Value: [Provided by Resend]

```

1. Wait for DNS propagation (can take up to 48 hours, usually 15 minutes)
2. Click "Verify Domain" in Resend dashboard
3. Once verified, all emails will start working! 

## Step 2: Add Gmail Fallback (RECOMMENDED)

Gmail can serve as a backup email system if Resend fails.

### Get Gmail App Password:

1. Enable 2-Factor Authentication on your Gmail account
2. Go to: <https://myaccount.google.com/apppasswords>
3. Create a new app password:
  - App name: "Mindful Champion"
  - Generate password (16 characters)
4. Copy the generated password

### Add to Environment Variables:

#### For Local Development (.env.local):

```
Gmail Credentials (Fallback Email System)
GMAIL_USER="your-email@gmail.com"
GMAIL_APP_PASSWORD="your-16-char-app-password"
```

#### For Vercel Production:

1. Go to: [https://vercel.com/\[your-project\]/settings/environment-variables](https://vercel.com/[your-project]/settings/environment-variables)
2. Add the following environment variables:

```
GMAIL_USER = your-email@gmail.com
```

```
GMAIL_APP_PASSWORD = your-16-char-app-password
```

3. Redeploy the application

## Step 3: Test Email System

Run the test script to verify everything works:

```
cd /home/ubuntu/mindful-champion
npm run test:scripts
```

Expected output after fixes:

- ✓ Test email sent successfully!
- ✉ Email ID: [email-id]
- ✨ Resend API is configured correctly and working!

## Step 4: Send Welcome Emails to Existing Users (If Needed)

If you have users who signed up but didn't receive welcome emails:

```
npx tsx scripts/send-missing-welcome-emails.ts
```

This script will:

- Find all users who didn't receive welcome emails
- Send welcome emails to them
- Update the database to mark emails as sent

## Current Email System Architecture

### Primary: Resend (Recommended for Production)

- **Email Service:** Resend
- **Domain:** mindfulchampion.com
- **From Addresses:**
  - `noreply@mindfulchampion.com` - System emails (signups, payments, rewards)
  - `partners@mindfulchampion.com` - Partner/sponsor communications
  - `dean@mindfulchampion.com` - Admin/support emails
- **Status:** ✗ Domain not verified (NEEDS FIXING)

### Fallback: Gmail/Nodemailer

- **Email Service:** Gmail SMTP
- **From Address:** Configured GMAIL\_USER
- **Status:** ⚠ Credentials missing (OPTIONAL)

### Email Flow:

1. App tries to send email via Resend
2. If Resend fails, falls back to Gmail (if configured)
3. All emails are logged to database ( `EmailNotification` table)
4. Admin can view email history at `/admin/email-notifications`

## Files Modified

---

### Fixed Files:

1. `lib/email/log-email.ts` 
  - Added missing `logEmailNotification` function
  - Used by unified-email-service for logging emails

### Key Email Files:

- `lib/email/unified-email-service.ts` - Main email sending service
  - `lib/email/resend-client.ts` - Resend API client
  - `lib/email/config.ts` - Email configuration (domains, accounts)
  - `lib/email/templates/welcome-email.ts` - Welcome email template
  - `lib/media-center/email-service.ts` - Media center specific emails
  - `lib/email.ts` - Gmail/Nodemailer fallback system
  - `app/api/signup/route.ts` - Signup handler (sends welcome email)
- 

## Action Items for User

---

### Immediate (Required):

1.  **Verify** `mindfulchampion.com` **domain in Resend** - This will fix ALL email issues
2.  **Add DNS records** to your domain registrar (see Step 1)
3.  **Wait for verification** (15 min - 48 hours)

### Optional (Recommended):

1.  **Add Gmail credentials** as fallback email system (see Step 2)
  2.  **Test email system** after domain verification (see Step 3)
  3.  **Send missing welcome emails** if you have existing users (see Step 4)
- 

## Support

---

If you encounter any issues:

1. **Check Resend Dashboard:** <https://resend.com/emails>
  - View delivery status
  - Check for errors
  - Monitor email metrics
2. **Check Application Logs:**

```
```bash
# In Vercel
Visit: https://vercel.com/\[your-project\]/logs
```

```
# Locally
npm run dev
```

```
# Watch console for email-related logs
```

```
...
```

1. Test Email Sending:

```
bash
```

```
npx tsx scripts/test-resend-api.ts
```

2. View Email History:

- Admin Dashboard: `/admin/email-notifications`

- Database: Check `EmailNotification` table

Notes

- The local database is empty, so production users are likely in a separate database
- The Resend API key (`re_MF3dtRp...`) is present but domain verification is blocking emails
- Once domain is verified, emails will work immediately without code changes
- All email templates are professional and ready to use
- Email logging is working correctly and will track all sent emails

Verification Checklist

After completing the setup:

- ☐ Resend domain verified and showing “Verified” status
- ☐ Test email sent successfully using test script
- ☐ Welcome email template renders correctly
- ☐ New user signup triggers welcome email
- ☐ Email appears in admin dashboard at `/admin/email-notifications`
- ☐ Email is logged in database `EmailNotification` table
- ☐ Gmail fallback configured (optional but recommended)

Status: Ready for deployment once domain is verified! 🚀
