

Authentication Fix Summary

Date: January 4, 2026

Issue: Login failing with “Invalid email or password” despite correct credentials

Root Cause Analysis

What Was Wrong:

1. Hardcoded Bypass with Wrong User ID

- The `lib/auth.ts` file contained a hardcoded bypass for testing
- This bypass used user ID: `cm8q738Kh9A2U0jg`
- The actual user ID in the database: `cmjxvkbv90000zyp2dgtduh97`
- This mismatch caused session/authentication issues

2. Database Connection Was Working

- Verified by “User already exists” message during signup attempts
- Direct password verification test confirmed bcrypt comparison works correctly
- Password hash: `$2a$10$Rco...` (60 characters, valid bcrypt format)

3. Excessive Debug Logging

- The `authorize` function had ~100 lines of debug logging
- This cluttered the code and made it hard to identify the actual issue
- Some logging was redundant and duplicated

What Was Fixed:

1. Removed Hardcoded Bypass

- Deleted the test bypass code that was returning a fake user object
- Now uses the normal authentication flow exclusively

2. Cleaned Up Authentication Logic

- Streamlined the `authorize` function from ~100 lines to ~60 lines
- Kept essential logging for debugging production issues
- Simplified error handling while maintaining comprehensive error tracking

3. Improved User Data Selection

- Added explicit field selection in Prisma query
- Ensures only required fields are fetched (`id`, `email`, `name`, `firstName`, `lastName`, `password`, `role`, `subscriptionTier`, `isTrialActive`, `onboardingCompleted`, `rewardPoints`)
- Improved name fallback logic: `name || firstName+lastName || email`

4. Better Error Messages

- Simplified console logs with `[AUTH]` prefix
- Clearer step-by-step progression
- Maintained exception tracking for debugging

Test Results

Before Fix:

- ✗ Login: "Invalid email or password"
- ✓ Database: Password verification works directly
- ✗ Issue: Hardcoded bypass with wrong user ID

After Fix:

- ✓ Removed hardcoded bypass
- ✓ Clean authentication flow
- ✓ Correct user ID from database
- ✓ Build successful
- ✓ Code pushed to GitHub

Verification Steps

1. Database Password Test:

bash

- ✓ User ID: cmjxvkbv90000zyp2dgtduh97
- ✓ Email: deansnow59@gmail.com
- ✓ Password: MindfulChampion2025!
- ✓ bcrypt.compare: VALID

2. Build Test:

bash

- ✓ npm run build: SUCCESS
- ✓ No TypeScript errors
- ✓ All routes compiled

3. Git Push:

bash

- ✓ Committed: 7db8162
- ✓ Pushed to: origin/master
- ✓ Vercel: Auto-deployment triggered

Next Steps

1. Clear Browser Cache & Cookies

- Go to `mindfulchampion.com`
- Open DevTools (F12)
- Application → Storage → Clear site data
- Or use incognito/private window

2. Wait for Vercel Deployment

- Check: <https://vercel.com/dean-snows-projects/mindful-champion/deployments>
- Wait for "Ready" status (usually 2-3 minutes)

3. Test Login

- Email: `deansnow59@gmail.com`

- Password: `MindfulChampion2025!`
- Should redirect to dashboard after successful login

4. Check Vercel Logs (if still failing)

- Go to deployment page
- Click “View Function Logs”
- Look for `[AUTH]` prefixed messages
- Should see:
 - `[AUTH] ===== AUTHORIZE START =====`
 - `[AUTH] User found: true`
 - `[AUTH] Password validation result: true`
 - `[AUTH] SUCCESS: Login completed`

Environment Variables to Verify

Make sure these are set in Vercel:

```
NEXTAUTH_SECRET=<your-secret>
NEXTAUTH_URL=https://mindfulchampion.com
DATABASE_URL=postgresql://...
```

Admin Account

✅ Verified Admin Credentials:

- Email: `admin@mindfulchampion.com`
- Password: `MindfulChampion2025!` (same as test account)
- Role: `ADMIN`
- Status: `onboardingCompleted: true`

Note: The “Internal server error” you saw was likely due to trying `Admin123!` which is incorrect. The correct password is `MindfulChampion2025!`

Technical Details

- **File Modified:** `lib/auth.ts`
- **Lines Changed:** 33 insertions, 57 deletions
- **Commit:** `7db8162`
- **Branch:** `master`
- **Deployment:** Auto-triggered on Vercel

Status: ✅ Fix deployed, awaiting Vercel deployment completion
