

Deployment Sync Solution - Quick Action Guide

Status:  Confirmed deployment mismatch

Date: December 26, 2025

Issue: Custom domain (mindfulchampion.com) serving different version than preview URL

Diagnostic Results

Confirmed Facts

-  **Domain Verification:** Completed successfully
-  **DNS Configuration:** Correct (pointing to 66.71.220.1)
-  **Latest Code:** Commit `0431cb5` pushed to GitHub
-  **Both URLs Accessible:** HTTP 200 responses
-  **SIZE MISMATCH:** Custom domain (116,588 bytes) vs Preview (112,349 bytes)
-  **DIFFERENT VERSIONS:** 4,239 byte difference confirms version mismatch
-  **BUILD NOT TRIGGERED:** Most recent build log from Nov 25 (outdated)

What This Means

The custom domain completed verification but the platform **has not yet synced it to the latest deployment**. The preview URL is serving the current version while the custom domain is serving an older cached version from before verification completed.

Immediate Action Required

Option 1: Platform Console (RECOMMENDED)

This is the fastest and most reliable method.

1. Go to App Management Console

- URL: https://apps.abacus.ai/chatllm/?appId=apllm_engineer
- Look for “Mindful Champion” application

2. Trigger Redeploy

Look for one of these options (depending on platform UI):

- “Redeploy” button
- “Rebuild” button
- “Sync Domain” option
- “Custom Domain” settings with “Refresh” or “Update” button
- “Deployment” tab with “Force Redeploy” option

3. Verify Deployment Triggered

- Check for build/deployment progress indicator

- Note the deployment ID or timestamp
- Monitor for completion (usually 10-15 minutes)

4. **Clear CDN Cache** (if option available)

- Look for "Purge Cache" or "Clear CDN Cache"
- This ensures fresh content is served immediately

Option 2: Git Push Trigger (BACKUP)

If no platform button is available, try triggering via Git:

```
cd /home/ubuntu/mc_deploy
./force-domain-sync.sh
```

This script will:

- Create a new force-rebuild timestamp
- Commit and push to trigger platform rebuild
- Display next steps and monitoring instructions

OR manually run:

```
cd /home/ubuntu/mc_deploy
echo "Force rebuild $(date +%Y%m%d%H%M%S)" > .force-rebuild
git add .force-rebuild
git commit -m "Trigger rebuild - sync custom domain"
git push origin master
```

Option 3: Contact Platform Support (IF NEEDED)

If Options 1 & 2 don't work within 30 minutes:

Email: support@abacus.ai

Subject: Custom domain deployment sync issue - mindfulchampion.com

Include:

- App Name: Mindful Champion
- Custom Domain: mindfulchampion.com
- Preview URL: mindful-champion-8zziwi.abacusai.app
- Issue: Custom domain showing old version after domain verification completed
- Latest Commit: 0431cb5
- Timestamp: Dec 26, 2025 02:39 UTC
- Request: Please trigger fresh deployment and sync custom domain to latest build

Attach: CUSTOM_DOMAIN_SYNC_REPORT.md (comprehensive diagnostic report)

Expected Timeline

Phase	Duration	What Happens
Trigger rebuild	Immediate	Platform receives deployment request
Build process	5-10 minutes	Next.js application builds
Deployment	2-5 minutes	New version deployed to servers
CDN propagation	5-15 minutes	Content delivery network updates
Total	15-30 minutes	Custom domain serves latest version

Verification Checklist

After 15-30 minutes, verify these on <https://mindfulchampion.com>:

Critical Visual Elements

- ☐ Dashboard has **vibrant dark slate gradient** (not washed out/faded)
- ☐ Navigation menu **does NOT have “Play” link**
- ☐ Navigation shows: Dashboard, Train, Compete, Connect, Media, Help, Profile

Video Analysis Lab (/train/video)

- ☐ **“Pro Comparison” mode** available in top toolbar
- ☐ Frame-by-frame delineation shows: **Setup → Contact → Follow Through**
- ☐ Data panels visible:
- ☐ **Power**: Shows reading with **mph** unit
- ☐ **Accuracy**: Percentage score
- ☐ **Form Score**: Rating
- ☐ **Overall Score**: Prominent panel with score
- ☐ **Skeleton overlay** visible on video frames
- ☐ Shot-specific metrics and scoring

Coach Kai (/train/coach)

- ☐ **Female avatar** (Kristin/Anna character) loads
- ☐ Voice is **“Sara”** (female voice, not male)
- ☐ State indicators working:
- ☐ **Green** = Listening
- ☐ **Purple** = Thinking
- ☐ **Amber/Gold** = Speaking

Tournament Hub (/compete/tournaments)

- [] Map shows **only future 2026 events**
- [] **No past events** displayed in list or map
- [] Tournament details load correctly

Troubleshooting

If Custom Domain Still Shows Old Version After 30 Minutes

Step 1: Clear Your Browser Cache

Chrome/Edge/Brave:

- Press `Ctrl + Shift + Delete` (Windows/Linux) or `Cmd + Shift + Delete` (Mac)
- Select “Cached images and files”
- Click “Clear data”

Firefox:

- Press `Ctrl + Shift + Delete` (Windows/Linux) or `Cmd + Shift + Delete` (Mac)
- Check “Cache”
- Click “Clear Now”

Safari:

- Press `Cmd + Option + E` to empty caches
- Or: Safari menu → Settings → Privacy → Manage Website Data → Remove All

Step 2: Hard Refresh

- Windows/Linux: `Ctrl + Shift + R`
- Mac: `Cmd + Shift + R`

Step 3: Try Incognito/Private Window

- Chrome: `Ctrl + Shift + N` (Windows/Linux) or `Cmd + Shift + N` (Mac)
- Firefox: `Ctrl + Shift + P` (Windows/Linux) or `Cmd + Shift + P` (Mac)
- Safari: `Cmd + Shift + N`

Step 4: Check Deployment Status

```
cd /home/ubuntu/mc_deploy
./check-deployment-status.sh
```

This will show:

- Current git commit status
- Build log timestamps
- URL response comparison
- Feature detection
- Recommendations

Step 5: Verify Build Logs

```
cd /home/ubuntu/mc_deploy
ls -lht *.log | head -5
```

Look for NEW log files dated Dec 26 or later. If still seeing Nov 25 dates, the rebuild hasn't triggered yet.

Step 6: Test with Cache Busting

```
# Add a query parameter to bypass cache
curl -I "https://mindfulchampion.com?v=$(date +%s)"
```

If this returns a different response than a regular request, it's a caching issue.

Monitoring Commands

Use these to check status during deployment:

```
# Quick status check
cd /home/ubuntu/mc_deploy && ./check-deployment-status.sh

# Watch for new build logs
watch -n 30 'ls -lht /home/ubuntu/mc_deploy/*.log | head -5'

# Compare URL responses live
watch -n 60 'echo "Custom:"; curl -s https://mindfulchampion.com | wc -c; echo "Pre-view:"; curl -s https://mindful-champion-8zziwi.abacusai.app | wc -c'

# Check git status
cd /home/ubuntu/mc_deploy && git status && git log -1

# View force rebuild file
cat /home/ubuntu/mc_deploy/.force-rebuild
```

Files Generated

This investigation created these files in `/home/ubuntu/mc_deploy/` :

1. **CUSTOM_DOMAIN_SYNC_REPORT.md** - Comprehensive diagnostic report (15+ pages)
2. **force-domain-sync.sh** - Automated rebuild trigger script
3. **check-deployment-status.sh** - Diagnostic and status checker
4. **DEPLOYMENT_SYNC_SOLUTION.md** - This quick action guide

Success Indicators

You'll know the sync was successful when:

1. **✓ Size Match:** Custom domain and preview URL return similar response sizes
2. **✓ Build Logs:** New build log file dated Dec 26 or later
3. **✓ Visual Match:** Custom domain shows same UI as preview (vibrant, no "Play" link)
4. **✓ Features Present:** Video analysis shows mph readings, Coach Kai is female

5.  **Status Check:** `./check-deployment-status.sh` shows “Deployments appear to be in sync”
-

After Successful Sync

Once verified working:

1. **Document the process** for future reference
 2. **Test all major features** to ensure everything works
 3. **Monitor performance** for 24 hours
 4. **Notify users** if you made any announcements about the site
 5. **Update DNS TTL** if needed (currently should be fine)
-

Prevention for Future

To avoid this issue again:

1. **Complete domain verification first** before major deployments
 2. **Monitor build logs** after every commit
 3. **Always test both URLs** after deployments
 4. **Keep deployment process documented**
 5. **Set up deployment webhooks** if platform supports them
 6. **Use deployment tags/releases** for important versions
-

Quick Reference

Item	Value
Custom Domain	https://mindfulchampion.com
Preview URL	https://mindful-champion-8zziwi.abacusai.app
Latest Commit	0431cb5
Commit Date	Dec 26, 2025 02:39:03 UTC
Force Rebuild	Dec 26, 2025 02:39:01 UTC
Project Path	/home/ubuntu/mc_deploy
Git Branch	master
Support Email	support@abacus.ai
App Console	https://apps.abacus.ai/chatllm/?appId=apllm_engineer

Next Immediate Steps

1. **NOW:** Go to https://apps.abacus.ai/chatllm/?appId=apllm_engineer
2. **FIND:** Mindful Champion app and look for “Redeploy” or “Rebuild” button
3. **CLICK:** Trigger the redeployment
4. **WAIT:** 15-30 minutes for build + deployment + CDN propagation
5. **TEST:** Visit <https://mindfulchampion.com> and verify checklist items
6. **REPORT:** Confirm success or escalate to support if still not working

Good luck! The issue is identified and fixable. Just need to trigger the platform to sync the custom domain to the latest deployment. 🚀
